

Abstract of the Invention

1
2 A system for a universal wireless development
3 platform contains a PCI or other bus for receiving
4 protocol modules used to emulate and test new or
5 updated wireless devices, such as next-generation
6 cellular telephones, pagers, personal digital
7 assistants and other devices. The electronics of
8 cellular telephones and other devices may be embedded
9 in these removable protocol modules, for testing and
10 alteration. Because the interfaces for various types
11 of devices are abstracted to a removable card, one
12 test bed may be used to build and exercise a variety
13 of devices, without a need to use different equipment
14 for each.
